## INTRODUCTION:

Healthy Ecosystems clean our water, purify our air, maintain our soil, regulate the climate, recycle nutrients and provide us with food. They provide raw materials and resources for medicines and other purposes. It's that simple we could not live without these "Ecosystem Services". The main function of Ecosystem Conservation is protecting or restoring the structure, function and species compilation within the system. This can get hard quickly, because everything in an Ecosystem affects everything else. The best way to conserve an Ecosystem is to approach it from a large scale view. If we conserve environment we conserve the natural resources. Because healthy Ecosystems sustain the fundamentals for human life and civilization. They clean the air and water that we are dependent on, provide important Natural resources. Healthy Ecosystems are necessary for food production free of toxins. So conservation of Ecosystem in a holistic way is a must for sustainable future.
